

ABSTRACT OF THE DISCLOSURE

A tool assembly and a method for forming a less invasive resection of a selected bone portion. For example, a distal femur may be resected with substantially a single minor incision. Tools may be positioned through the single incision to resect a portion of the condyles of the femur. Generally, the medial condyle is resected followed by resecting a lateral condyles, but each condyle may be resected at a selected time through a single minor incision.
